Installation Variations

A stainless steel shroud may be purchased to protect the waterline between the floor and the Ritchie Stall Fount. Part number 18092 includes two sections of shroud, 19 ³/₄ inches long. This part is not required for the non-electric Stall Fount.

Installing the shroud - After the plumbing connections are made, install the optional shroud using 1/4" lag screws or bolts. When more than one section of shroud is used, the total length of the shroud can be adjusted in 6" increments by removing insulation as needed and moving top shroud down to align next set of holes.

Installation Instructions for

Ritchie® Stock Tank Valve

Part Number 18141

The Ritchie Stock Tank Valve is designed to fit on either plastic or steel tanks. The single bracket that is included can be orientated one of two ways depending on the tank you are mounting the unit to. The following describes how this bracket should be mounted for either type of tank installation.

1. Place the backing plate on the inside of the blue valve housing. Align all three holes and place the two short bolts through the two bottom holes from the inside out. Ensure that the center hole lines up with the hole on the valve housing, as it provides ventilation to prevent a vacuum from forming in the valve chamber.
2. Mount the angle bracket with the short side of the bracket touching the valve housing for plastic tanks, and long side touching the housing for steel tanks. The angle bracket should be mounted so the bend of the bracket is below the mounting holes, not on top.
3. Align the bolts sticking through the backing plate, housing, and angle bracket. Use the provided lock washer and nuts to fasten the assembly.
4. To mount the unit to the tank, use the outer and center holes to bolt to the bracket to the tank. For plastic tanks there are a pair of holes on each end and in the center you may use the set of holes close to the valve housing, or further out on the bracket, whichever fits your tank better. For steel tanks there is only one set of holes. Use the angle bracket itself as a template to mark the three holes.
5. With a 5/16" bit, drill out the three pre-marked holes. NOTE: FOR STEEL TANK HOLES MAY HAVE TO BE DRILLED AT AN ANGLE TO GO ALL THE WAY THROUGH THE RIM SO BOLTS MAY BE INSTALLED.
6. Lay the bracket on top of the holes that you just drilled and insert the three ¼-20 x 2 ½ hex head screws. Apply the remaining lock washers and nuts to the bottom of the screws and tighten.

The drawing at left shows the angle bracket oriented for use with plastic tanks. For use on steel tanks, orient as below:

TROUBLE-SHOOTING GUIDE FOR RITCHIE FROST FREE HYDRANTS

1. If hydrant continues to drip after handle is closed, the plunger rod may need to be adjusted.
 - a. Loosen hex nut #11, on top of plunger rod #17
 - b. Open the hydrant handle #5 partially to relieve pressure on plunger rod.
 - c. Turn the lower hex nut #12 on plunger rod #17 approximately $\frac{1}{2}$ to 1 turn toward top of rod.
 - d. Tighten top hex nut #11 onto plunger rod.
 - e. Close hydrant handle. Check for leaks.
2. If hydrant continues to drip after adjusting the plunger rod, the leather washer #25 on the plunger assembly #20 needs to be replaced. **NOTE:** *This can be done without removing hydrant from ground.*
 - a. Shut water supply off.
 - b. Remove plunger rod nuts and washers #11 & #12, and the rocker arm pin and retaining ring, #8.
 - c. Remove packing nut #14 and packing gland #15 by turning counterclockwise.
 - d. Pull plunger rod #17 & #18 up through hydrant pipe #24, without turning rod as this may damage washer and plunger sleeve. **NOTE:** *Due to calcium (lime) or iron buildup in the valve chamber above the plunger assembly, it may be difficult to remove the plunger rod assembly. The hydrant should be flushed after removing hydrant rod assembly by turning water supply on, momentarily, and then turning off again.*
 - e. Inspect leather washer #25 and rubber plunger #22 for wear and, or damage. Replace if necessary.
 - f. Re-install plunger rod into hydrant, and replace rocker arm and plunger nuts and washers and adjust, and then turn on water supply and test for leaks.
3. If hydrant continues to leak, after replacing plunger assembly, the valve chamber #19 needs to be replaced. **NOTE:** *The hydrant must be removed from ground for this repair.*
4. If hydrant leaks around plunger rod #17 in hydrant head, the brass packing nut #14 may need adjusting.
 - a. Tighten brass packing nut #14 into plastic packing gland fitting #15, approximately $\frac{1}{4}$ turn at a time.
 - b. If this does not stop the leak, the packing #16 may need to be replaced. To do this, the rocker arm and adjusting nuts must be removed as described above. The packing nut #14 must then be removed by turning counter clockwise. The packing gland #15 also needs to be removed by turning counterclockwise. The packing can be removed by using a $\frac{1}{2}$ " to $\frac{5}{8}$ " dia. drill bit. Be careful not to drill too deep into packing gland or it can be damaged. The packing gland could also be replaced at this time.
 - c. Inspect the hydrant rod extension #17 for wear and damage at this time, it should be smooth. Replace if damage is evident or it shows wear on one side of the rod.
5. If hydrant freezes in the winter, the drain weep hole in the valve chamber #19 is plugged, the valve is leaking, or the ground water level is too high. If drain hole is plugged, it may be possible to clean it out, by back flushing after the hydrant is unfrozen. This can be done, by connecting a pressurized water or air source to the hydrant outlet hose fitting #3, while the handle is closed.

CAUTION: *Do not use more than 125 psi pressure source.*
